

# Transwall Care & Cleaning for Double Glaze Products

To maintain quality, clarity, and protect your warranty, please follow the below guidelines regarding Double Glaze Panels and Doors:

For double glaze doors and panels, only use the following approved cleaning products and techniques:

- Diluted isopropyl alcohol
- Diluted ammonia-based cleaner, i.e. Windex - use ONLY this type of cleaner in instances that have applied film and refer to the film vendor's recommended cleaning specifications
- Avoid soaking the panel with cleaning solution, i.e. a bucket of water. This increases the risk of moisture collecting between the panels. Lightly misting the glass surface with a spray bottle is the best method to prevent possible damage.
- Do NOT use cleaners containing Borax, sodium borate, sodium tetraborate, or disodium tetraborate

Double Glaze Products can only be installed with the appropriate work site conditions:

- A job site that is as free as possible of dust, debris, etc. Otherwise particles can be trapped between panels.
- A properly functioning HVAC system that maintains a 50% or less humidity within the space. Installing in an environment without a proper HVAC system and high humidity increases the risk of fogging/ streaking between the glass panels.
